

From 4 messy job boards to one clean data model.

Scrapers → Databricks → Power BI

THE PROBLEM

Job market data is messy.

- 4 job boards, each with its own schema
- 4 languages of job postings
- Salaries in a dozen different formats
- The same role repeated across portals

THE PIPELINE

One reproducible flow.

Azure Data Lake Storage Gen2 → Bronze → Silver → Gold
Every layer versioned in Git — no click-ops.

SILVER · THE HARD PART

Where noise becomes data.

- Columnar PySpark, zero UDFs
- Skills and seniority extracted from free text
- Work mode parsed in multiple languages
- Salaries normalized to annual EUR — only when the period is known

GOLD

A star schema BI can read.

- fact_offers — one row per unique posting
- fact_offer_skills — one row per offer + skill
- Conformed dimensions: currency, skills, calendar, geography
- Simple relationships, fast aggregations

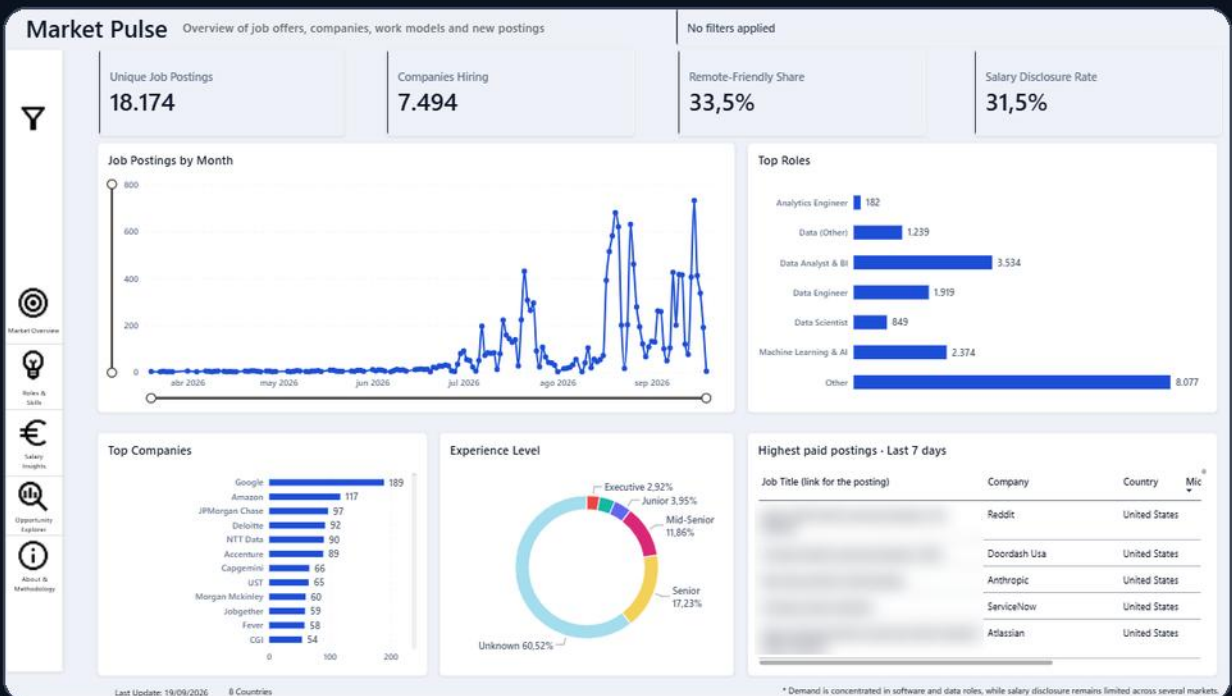

DATA QUALITY

Modeled, not hoped for.

- Every salary is classified: ok / missing / unknown_period / outlier_review / invalid
- Posting dates keep their provenance (posted vs scraped)
- If the period is unknown, the value is never guessed
- Coverage and freshness surfaced in the report itself

Roles & Skills

Roles & Skills Most demanded skills and categories across all offers

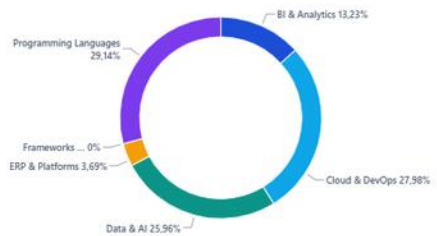

Salary Min: 0 €

Y

Which skills combine market demand and high salary?

Skill Demand by Category

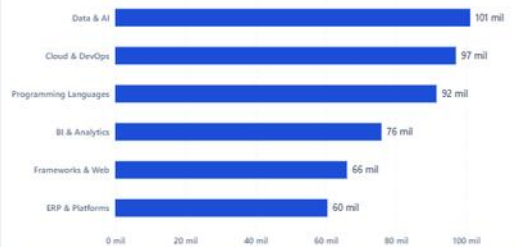

Skills Benchmark

Skills are ranked by unique postings mentioning each skill

Skill	Category	Offers By Skill With Salary	Demand (Offers)	Share	Median Salary (EUR)
Deep Learning	Data & AI	73	161	0.9%	133,368
PyTorch	Data & AI	106	234	1.3%	131,367
TensorFlow	Data & AI	97	193	1.1%	131,217
Kubernetes	Cloud & DevOps	102	540	3.0%	120,168
Machine Learning	Data & AI	395	960	5.3%	117,000
NLP	Data & AI	76	165	0.9%	112,656
Terraform	Cloud & DevOps	70	316	1.7%	112,241
GCP	Cloud & DevOps	136	567	3.1%	110,244
